

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

Read more about Early Journal Content at <http://about.jstor.org/participate-jstor/individuals/early-journal-content>.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

## SCIENCE:

A WEEKLY NEWSPAPER OF ALL THE ARTS AND SCIENCES

PUBLISHED BY

N. D. C. HODGES,

47 LAFAYETTE PLACE, NEW YORK.

SUBSCRIPTIONS.—United States and Canada.....\$3.50 a year.

Great Britain and Europe..... 4.50 a year.

Communications will be welcomed from any quarter. Abstracts of scientific papers are solicited, and twenty copies of the issue containing such will be mailed the author on request in advance. Rejected manuscripts will be returned to the authors only when the requisite amount of postage accompanies the manuscript. Whatever is intended for insertion must be authenticated by the name and address of the writer; not necessarily for publication, but as a guaranty of good faith. We do not hold ourselves responsible for any view or opinions expressed in the communications of our correspondents.

Attention is called to the "Wants" column. All are invited to use it in soliciting information or seeking new positions. The name and address of applicants should be given in full, so that answers will go direct to them. The "Exchange" column is likewise open.

## LETTERS TO THE EDITOR.

\*.\* Correspondents are requested to be as brief as possible. The writer's name is in all cases required as proof of good faith.

The editor will be glad to publish any queries consonant with the character of the journal.

On request, twenty copies of the number containing his communication will be furnished free to any correspondent.

## The Threatened Abandonment of the National Zoölogical Gardens.

A LITTLE over a year ago it was the source of the very greatest gratification to American science that the bill before Congress had passed, and a liberal initial appropriation had been made to establish a national zoölogical garden at the seat of the general government at Washington. Outside of strictly scientific circles, thousands upon thousands of earnest sympathizers all over the country likewise rejoiced in the success of the movement. The great mass of intelligent and cultured people of this nation felt a secret satisfaction when the broad project took on shape and became a living fact. Thoughtful men, wise and far-reaching minds, felt it to be one of the best indices of our national growth, culture, and civilization; for we well know that the nations of the world most distinguished for such characters invariably support such institutions, as they do, indeed, great libraries, galleries of art, and the museums.

To-day it is with deep concern that the intelligent well-wishers — and their name is legion in America — regard the miserable wrangle that is now being enacted in Congress over this entire matter, — an ill-directed debate, that, as it proceeds, daily enhances the danger of defeating the entire measure, undoing all the good that has been done. Nor is this feeling of concern confined to this country; for science the world over deplores the present state of affairs just as much as we do, for there is a broad freemasonry among those who have at heart the progress of learning, the aims of general education, and the advancement of any step that promotes a truer civilization.

But, upon my word, I am almost constrained to believe sometimes that the *personnel* of this government of ours really believes that we have arrived at such a high pitch of civilization in the United States that we are above all such matters: in fact, we are living in an atmosphere far above such questions as the maintenance of public libraries, zoölogical gardens, national universities, or museums.

Viewed from this point, it is a delightful thing to contemplate the marvellous rapidity with which our present-day civilization is advancing. To touch upon a few practical points in the question

now under consideration, the writer is moved to say, and I believe I voice the opinions of many other scientists beside myself, that the greatest praise was due to Mr. W. H. Hornaday and Senator Beck for their unflagging energy in carrying through Congress the bill to establish our National Zoölogical Gardens; that the people of the District of Columbia, and of Washington in particular, lent their most hearty aid in the premises, as would any other honest and patriotic American city in the same place, and now it is an outrage to expect her to support any part of what purports to be a purely national enterprise; that the Rock Creek Park is one thing, and the National Zoölogical Garden is another; that, as highly important as an astro-physical laboratory is, and notwithstanding the evident demand for such an institution, it surely has nothing to do with a zoölogical garden, any more than the moon has to do with the beard on the chin of a buffalo; that the time has most assuredly arrived for this country to establish, support, and maintain a complete, extensive, and properly conducted national zoölogical gardens at the seat of her general government, — gardens that can at least rival those of Regent's Park in London, or the superb ones maintained at Amsterdam; and assuredly nothing less, or none at all. My views upon the conduction of such establishments, together with their aims and uses, have already been published in *The Popular Science Monthly* of New York (April, 1889), and those views were very fully republished in *The Evening Star* of Washington, D.C.: so it is quite unnecessary to touch upon that part of the subject again in the present connection.

R. W. SHUFELDT.

Takoma, D.C., Feb. 26.

## A Water-Beetle.

LATELY I kept for a few days for inspection that very beautiful insect a water-beetle. The specimen was large and splendidly colored, gold-banded, and displaying brilliant iris hues on its legs. I placed it in a glass jar of water. On the surface of the water some leaves were laid. On one side of the jar, at the bottom, was pasted a square of paper, and to the shelter of this the beetle often retired. It seemed to take the greatest delight in darting, swimming, and diving, rising from the bottom of the jar to the top of the water by long, vigorous strokes of its hind-legs. Then joining its second pair of legs before it, like a swimmer's hands, and stretching the hind pair out nearly together, it would dive to the bottom. It slept hanging head downward under the leaves, with the tip of the body above the water to secure air.

It showed the pleasure of a child in "blowing bubbles." Rising to the surface, it would put the tip of its body above the water, part the elytra, and take in air; then, closing its case, it would dive to the bottom, stand on its head, emit the air-bubble by bubble until it was exhausted, and come up for a new supply. It seemed to need the daily renewal of the water in the jar. When it was hungry, or the water was not fresh enough, it became dull and sulky, and hid behind the paper. After the beetle had fasted twenty-four hours, I laid on the top of the water a wasp, a mosquito, a blue-bottle fly, and a common fly, all dead. The beetle, being at the bottom of the jar, did not seem to see or smell these insects. Rising presently, he came up against the mosquito, seized the body in his jaws, and sucked it dry with one pull. He then found the blue-bottle, carried it down to the shelter of the paper, trussed it neatly, cutting off the wings, legs, and head, and letting them float to the surface. He then held the body in his hands, or short front-feet, pressed to his jaws, and sucked it dry. After this he rose to the surface, found the other fly, and served it in the same fashion. Next he found the wasp, a large one. Carrying this below, as he had the flies, he clipped off the wings and legs, but took the precaution to suck the head and thorax before turning them adrift. He also grasped the body in his hands, pressed the part that had been cut from the thorax to his mouth, and, holding it exactly as if drinking out of a bottle, he drained it dry.

I found that he could eat all the time, except when he was asleep or playing, and his activity was in proportion to the quantity of his food. Cooked meat he would none of. Raw beef he did not greatly like, but raw veal he prized even above wasps and

blue-bottles. I cut an ounce of raw veal into dice, and dropped it in the bottom of the jar in a heap. He did not seem to see or smell it, but after a while happened to dive into it. He appeared to be full of joy at the discovery. One fragment after another he took in his hands, held it closely to his jaws, and sucked it dry by strong pulls. At each pull I could mark the receding red juice of the meat. When the veal was reduced to a pale fibre, he let it go and took a fresh bit. He always retired to the shelter of the paper to eat, with the sole exception of the mouthful he made of the mosquito. Like the King of Dahomey, he would not eat in public.

JULIA MCNAIR WRIGHT.

Fulton, Mo., Feb. 26.

### Cold and Warm Waves

THE observations taken at the meteorological establishment on the Eiffel Tower in Paris have led to several most interesting results; and among other things it has recently been found that the velocity of the air during an ordinary strong wind is about twice as high at the top of this tower as it is at its base. Such being the case, we should expect to find advancing cold or warm waves far ahead in upper regions of what they are closer to the earth's surface; and so they actually are found to be, as mentioned by Professor Hazen in your last issue, when he says that the temperature change at isolated mountain-peaks, as Mount Washington or Pike's Peak, occurs several hours earlier at their tops than at their bases, or when he says that high areas, etc., advance with a velocity double that of the surface air. These phenomena give us, therefore, a very instructive illustration or proof of the effect of the friction between the earth's surface and the air moving over it; and they confirm the old popular belief that weather-changes are brought about by the wind, or, what amounts to the same thing, that the advance of cold and warm waves is entirely due to mechanical action, or displacement of the surface-air as a body, in conformity to such rules as I have set forth in my paper, "On the Cause of Trade Winds" (*Transactions of the American Society of Civil Engineers*, vol. xxiii.), which paper also gives a very simple clew to the increased cold or heat in the border current of cold and warm waves.

Professor Hazen, however, does not appear to be acquainted with the important results of these observations at Paris, when he concludes that the changes in temperature and humidity of the air accompanying the advance of these waves cannot be due to the wind, or are entirely independent of the motion of a mass of air, although he curiously enough states at the same time that a rapid motion of an advancing wave has a tendency to increase the wind, which seems contradictory.

Starting from these false premises, no wonder our meteorologist arrives at some most startling results. He finds that the moisture of the air is "removed," "eliminated," or, as he says elsewhere, "sucked out" of the air in less than no time by some mysterious agency or another which cannot as yet be accounted for. Storms are transported or transferred through the air without the air-particles being moved at all. Indeed, when it is considered that the literal meaning of the word "storm" is "violent agitation or commotion," or, in other words, "wind," he wants to tell us that when a wind blows, the air-particles don't move at all: it is all deception, and the storm is due to electric energy or something else. The professor's mistaken notion here is, however, precisely similar to the one I pointed out in my last letter, when I tried to explain the fallacy of the result he arrived at,—that condensation did not always take place when saturated air "got chilled." His ideas of the principles of motion seem to differ remarkably from those engineers are accustomed to go by.

Finally, an entirely different subject is brought up by him, and treated in the same mysterious manner: "A portion of the heat in our storms is due to a peculiar condition of the atmosphere which intercepts the heat of the sun, and this heat gradually works down from the upper atmosphere to the earth." Mightn't it be simpler to say that when the sun is prevented from warming the earth's surface, its heat is taken up by the clouds, and consequently, when the cloud-carrying layers are brought near the earth's surface, as we know they are towards rain, this heat is felt by us?

Professor Hazen is a meteorologist without a theory; and, although it may be much easier to run down than to build up, no doubt he has done excellent service by constantly finding fault with others in just conformity to this negative standpoint; but, as the professor always seems so very anxious "to strike at the very heart of present theories of storm-generation," and this evidently in his strong point, I may recommend him to strike at the heart of a rain theory I some time ago had the honor of presenting to the American Society of Civil Engineers, and he may thereby possibly be able to prove that his notions of the principles of motion, etc., are more correct than those held and practised by the members of that distinguished body.

Brooklyn, N.Y., March 2.

### The Piney Branch Indian Workshop.

THE "Annual Report of the Curator of the Museum of Archaeology, Philadelphia" (Vol. i. No. 1) contains a criticism of recent work done, and conclusions drawn, by Mr. W. H. Holmes of the Bureau of Ethnology at the Piney Branch Workshop, near Washington, D.C., and of Mr. Holmes's papers thereon (*American Anthropologist* of January and July, 1890), that to the writer appears to do great injustice to Mr. Holmes.

In his report, Dr. Abbott, who has visited the site and obtained specimens therefrom through Mr. Holmes, says, "The enormous number of 'blocked out' implements have recently been held as conclusive evidence that such objects are to be considered as 'failures,' and, this being so, that similar objects found under any circumstances in this country are of like signification." To such conclusion the doctor dissents (p. 8).

Again he says, "While the position taken by Mr. Holmes and others as to the archaeological significance of the Piney Branch deposits may be wholly correct, and stand the test of every objection, the inferences drawn are too sweeping, and have not necessarily the bearing upon the question of man's antiquity in America which he practically claims. The conditions under which rude paleolithic implements occur in the valley of the Delaware are wholly different. Here they are characteristic of a horizon; are so associated with a well-marked deposit, that by no verbal jugglery can they be relegated to 'incongruous association,' and so are adventitious" (p. 9).

And concluding, the doctor says, "On the other hand, to accept Mr. Holmes's conclusion, that all rude implements, howsoever and wheresoever found, are Indian 'failures,' is not merely to remove from the class of implements the so-called 'turtle-backs' of the Delaware valley, but to remove the paleolithic implements of Europe, Asia, and Africa from the prehistoric archaeology of those continents."

Mr. Holmes is an officer of the Bureau of Ethnology, whose works on pottery, on the antiquities of the South-West, and on the Chiriquian objects, have familiarized his name to all students of American archaeology as a most painstaking and careful investigator; and, had he taken the ground asserted, he would have laid himself open to the charge of want of due care in conducting a scientific work.

Thus it will be observed that Dr. Abbott first says the Piney Branch objects "have recently been held as conclusive evidence that such objects are to be considered as failures," and dissents from such conclusion. Again he says, "Whilst the position taken by Mr. Holmes and others" may be correct as to Piney Branch, the conclusions are too sweeping, and have not the bearing which he (Mr. Holmes) practically claims. And in conclusion, Dr. Abbott, while claiming that the discovery of paleolithic implements of the Delaware valley occurred under different conditions from those under which the implements at Piney Branch were found, says the Delaware valley implements "by no verbal jugglery can be relegated to 'incongruous associations.'" The report starts by saying that the Piney Branch objects "have been held," and, later on, by "Mr. Holmes and others." In the last part of the latter sentence in which "Mr. Holmes and others" occurs, the doctor, in specifying Mr. Holmes individually, saddles the latter with conclusions which began with "have been held," and then defends the paleoliths of the Delaware from being by "verbal
